## **Emission reduction of internal combustion engines with advanced control** and machine learning techniques

## Masoud Aliramezani<sup>1</sup>, Armin Norouzi<sup>1</sup>, David Gordon<sup>1</sup>, Charles Robert Koch<sup>1</sup>

BACKGROUND	AIMS AND OBJECTIVES
<ul> <li>New engine control strategies are needed to meet the stringent emission regulations.</li> </ul>	<ul> <li>Fast response emission sensors have become essential for on-board emission measurement in the exhaust gas and for engine feedback control.</li> </ul>
<ul> <li>High combustion temperature and the lean air-fuel mixture of Diesel engines lead to a relatively high NO<sub>x</sub> emission.</li> </ul>	<ul> <li>Combining advanced machine learning techniques with physics-based understanding of fast response electrochemical sensors, provides a powerful tool for accurately simulating the sensor and optimizing its</li> </ul>
<ul> <li>Reducing CO and unburned hydrocarbons are challenges of homogeneous</li> </ul>	performance.

charge compression ignition (HCCI) engines.

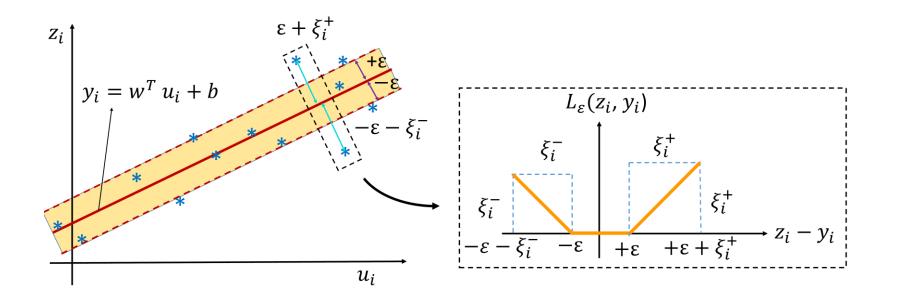

Mole fraction of

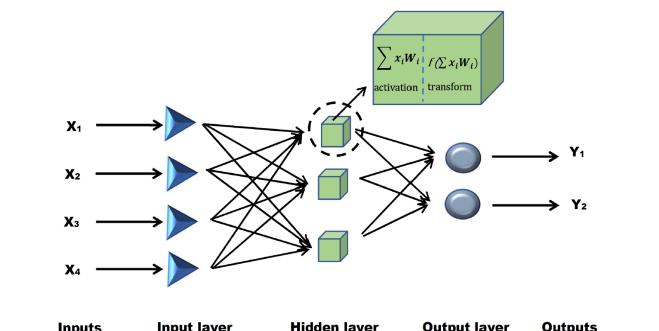

## **METHODOLOGY**

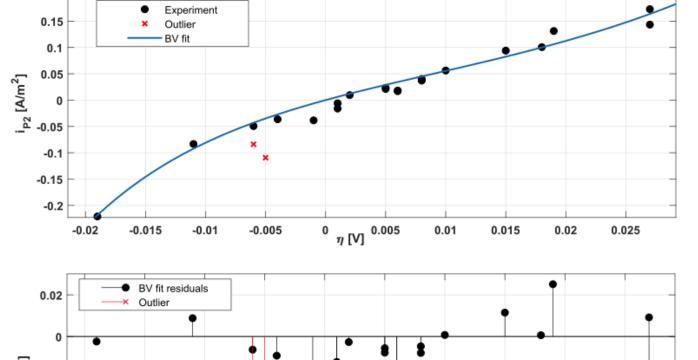

- Advanced Machine learning techniques are used to understand the complex behavior of internal combustion engines and fast response emission sensors.
- Physical understanding of the fast response emission sensors • are combined with the advanced machine learning techniques to develop smart grey box sensor models. Experiment

O<sub>2</sub> & NO<sub>2</sub> reduction on the electrod

 Artificial Neural Network (ANN) and Support Vector Machine (SVM) methods are used to predict and optimize the performance of ICEs and electrochemical sensors.
